

Evidence-Gap Assessment: Architecture

Assessment of OptArrow Base Practices

Base Practice	Status	Rationale
Prepare for architecture definition.	EvidenceStatus.PARTIAL_EVIDENCE	The existing claims suggest the architecture definition has been partially addressed, as seen with integrating varied client interfaces. However, there is no substantive evidence indicating a comprehensive roadmap or strategy as described in this base practice.
Develop architecture viewpoints.	EvidenceStatus.PARTIAL_EVIDENCE	The architecture supports multiple runtime environments and client interfaces, suggesting a broad architectural vision. Yet, specific viewpoints or the rationale behind framework selection aren't clearly detailed in the provided claims.
Develop models and views of candidate architectures.	EvidenceStatus.PARTIAL_EVIDENCE	Models of candidate architectures were possibly developed considering the evidence of adaptation to different runtime environments. However, detailed models or views expressing stakeholder concerns or requirement fulfillment have not been discussed.
Relate the architecture to design.	EvidenceStatus.PARTIAL_EVIDENCE	Connections between architectural decisions and implemented design occur with Python, Julia, and interface layers. Nevertheless, the primary design principles remain undefined based on the claims.

Assess architecture candidates.	EvidenceStatus.NO_EVIDENCE_IDENTIFIED	The provided claims offer no insight or evidence about active assessments or comparisons of candidate architectures against stakeholder requirements or other constraints.
Manage the selected architecture.	EvidenceStatus.PARTIAL_EVIDENCE	While integration aspects suggest governance over architecture (e.g., handling client languages), explicit formal governance or evolution management steps aren't detailed in the claims.
