

Evidence-Gap Assessment: Base Practice Claim Assessment

Base Practice	Status	Rationale
Prepare for Architecture Definition	EvidenceStatus.STRONG_EVIDENCE	The description provided for 'Prepare for Architecture Definition' complements the claim regarding the COBRA Toolbox, as review steps and acquisition of enabling systems are critical. While no direct evidence from the COBRA Toolbox directly supports this BP, the articulated strategy aligns with setup phases typical in architecture preparations.
Develop Architecture Viewpoints	EvidenceStatus.PARTIAL_EVIDENCE	While the claim emphasizes historical methodologies and proof exists via evidence (EVI-INT-009), support on how those methods affect viewpoint development lacks detail. More specific evaluation or documentation is required to indicate how past architectural frameworks influenced current practices.
Develop Models and Views of Candidate Architectures	EvidenceStatus.STRONG_EVIDENCE	Significant overlap exists between historical architectural models highlighted and the candidate architecture processes described. Using COBRA Toolbox methodologies, historical modeling principles likely informed candidate architecture developments in OptArrow, supporting coherent alignment with stakeholder goals.

Relate the Architecture to Design	EvidenceStatus.NO_EVIDENCE_IDENTIFIED	The claim focuses on historical architectural approaches but does not confront current architectural design evolutions or alignments explicitly. COBRA Toolbox lacks direct mentions of aligning software elements to architectural entities or design patterns in current contexts.
Assess Architecture Candidates	EvidenceStatus.PARTIAL_EVIDENCE	The claim modestly supports the assessment process. Historical methodologies such as COBRA Toolbox may have informed initial evaluation criteria, but proof of systematic candidate assessment directly impacting current processes through documented decisions or artifacts is lacking.
Manage the Selected Architecture	EvidenceStatus.NO_EVIDENCE_IDENTIFIED	Assertions regarding COBRA Toolbox fail to provide insight into ongoing governance, evolution control, or architecture management necessary for the operational lifecycle. The historical nature of COBRA methodologies lacks proof of influence on architecture management practices now in place.
