

Evidence-Gap Assessment: TEC.3 System/ Software Requirements

Base Practice	Status	Rationale
Prepare for system/ software requirements definition.	EvidenceStatus.PARTIAL_EVIDENCE	The provided claims focus on the use of Apache Arrow in the project's architecture and decision-making reliance on strategic guidance, both of which relate more to architectural choices and decision processes rather than specific preparations for system/software requirements. However, partial evidence is present in the strategic guidance aspect, which may tie into the planning items described in the practice.
Define system/ software requirements.	EvidenceStatus.NO_EVIDENCE_IDENTIFIED	The claims do not provide information pertinent to defining system/software requirements, such as functional definitions, operational modes, constraints, or risk-related needs. They focus more on architectural choices and high-level decision processes, which do not match the criteria of this practice.
Analyse system/ software requirements.	EvidenceStatus.NO_EVIDENCE_IDENTIFIED	There are no valid connections between the claims and the analysis of system/software requirements activities such as defining performance measures or resolving requirement deficiencies. The claims specifically address architecture reliability and decision-making inputs, which do not pertain to this practice.

Manage
system/
software
requirements.

EvidenceStatus.NO_EVIDENCE_IDENTIFIED

No aspects of the claims reflect the activities described in this base practice that involve obtaining agreements, maintaining traceability, and managing artefacts or baselines. The claims relate to strategic guidance and architectural decisions, which do not address requirements management.
