

Evidence-Gap Assessment: Claims

Assessment against Base Practices

Base Practice	Status	Rationale
Prepare for system/ software requirements definition	EvidenceStatus.PARTIAL_EVIDENCE	While exploration into enabling services and systems is suggested by the CLAIM-007 reference to architectural approaches, evidence for a systematic approach in defining the boundary and strategy, vital for enabling the system/software requirements definition, is partially reflected.
Define system/ software requirements	EvidenceStatus.PARTIAL_EVIDENCE	The use of GitHub Issues (ref: CLAIM-004) suggests efforts to define requirements. However, the claim points to missing traceability and formal integration, reflecting a partial establishment of defined requirements.
Analyse system/ software requirements	EvidenceStatus.NO_EVIDENCE_IDENTIFIED	The available claims do not provide evidence of a systematic analysis and feedback loop typical in requirement analysis. Feedback mechanisms exist (ref: CLAIM-004) but lack formal integration and analysis tracking.
Manage system/ software requirements	EvidenceStatus.NO_EVIDENCE_IDENTIFIED	The claims highlight the absence of traceability and formalized evidence tracking (ref: CLAIM-004 and CLAIM-007); this indicates potential gaps in managing requirements effectively, lacking formal agreement and traceability structures.
